ARDUINO

ASTORINO ARDUINO LIBRARY

Preface

This manual describes the Arduino library of the 6-axis robot "astorino"

The ASTORINO is a learning robot specially developed for educational institutions. Pupils and students can use the ASTORINO to learn robot-assisted automation of industrial processes in practice.

Arduino is an open-source electronics platform based on easy-to-use hardware and software. It's intended for anyone making interactive projects.

ASTORINO ARDUINO LIBRARY

1. The "astorino" software included with the ASTORINO is licensed for use with this robot only and may not be used, copied or distributed in any other environment.
2. Kawasaki shall not be liable for any accidents, damages, and/or problems caused by improper use of the ASTORINO robot.
3. Kawasaki reserves the right to change, revise, or update this manual without prior notice.
4. This manual may not be reprinted or copied in whole or in part without prior written permission from Kawasaki.
5. Keep this manual in a safe place and within easy reach so that it can be used at any time. If the manual is lost or seriously damaged, contact Kawasaki.

All rights reserved.

Symbols

Items that require special attention in this manual are marked with the following symbols.

Ensure proper operation of the robot and prevent injury or property damage by following the safety instructions in the boxes with these symbols.

WARNING

Failure to observe the specified contents could possibly result in injury or, in the worst case, death.

[ATTENTION]

Identifies precautions regarding robot specifications, handling, teaching, operation, and maintenance.

WARNING

- 1. The accuracy and effectiveness of the diagrams, procedures and explanations in this manual cannot be confirmed with absolute certainty. Should any unexplained problems occur, contact Kawasaki Robotics GmbH at the above address.**
- 2. To ensure that all work is performed safely, read and understand this manual. In addition, refer to all applicable laws, regulations, and related materials, as well as the safety statements described in each chapter.
Prepare appropriate safety measures and procedures for actual work.**

ASTORINO ARDUINO LIBRARY

Paraphrases

The following formatting rules are used in this manual:

- For a particular keystroke, the respective key is enclosed in angle brackets, e.g. <F1> or <Enter>.
- For the button of a dialog box or the toolbar, the button name is enclosed in square brackets, e.g. [Ok] or [Reset].
- Selectable fields are marked with a square box . If selected a check mark is shown inside the symbol .

1 Nomenclature in this manual

The author of the manual tries to use generally valid terminology while achieving the greatest possible logical sense. Unfortunately, it must be noted that the terminology is reversed depending on the point of view when considering one and the same topic. Also it is to be stated that in the course of the computer and software history terminologies developed in different way. One will find therefore in a modern manual no terminologies, which always satisfy 100% each expert opinion.

ASTORINO ARDUINO LIBRARY

2 Overview of ASTORINO

The ASTORINO is a 6-axis learning robot developed specifically for educational institutions such as schools and universities. The robot design is based to be 3D printed with PET-G filament. Damaged parts can be reproduced by the user using a compatible 3D printer.

Programming and control of the robot is done by the "astorino" software.

The latest software version and 3D files can be downloaded from the KAWASAKI ROBOTICS FTP server:

<https://ftp.kawasakirobot.de/Software/Astorino/>

Just like Kawasaki's industrial Robots the ASTORINO is programmed using AS language. Providing transferable programing skills from the classroom to real industrial applications.

****Disclaimer of Warranties****

The software is provided "as is," without warranty of any kind, express or implied, including but not limited to the warranties of merchantability, fitness for a particular purpose, and non-infringement. In no event shall the authors or copyright holders be liable for any claim, damages, or other liability, whether in an action of contract, tort, or otherwise, arising from, out of, or in connection with the software or the use or other dealings in the software.

ASTORINO ARDUINO LIBRARY

3 Technical specifications

Characteristics	ASTORINO
Type	6-axis robot
Max. lifting capacity	1 kg
Number of axes	6
Max. range	578 mm
Repeatability	±0.2 mm
Motion range	Axis 1 (JT1) ±158°
	Axis 2 (JT2) -90°÷127°
	Axis 3 (JT3) -168°÷0°
	Axis 4 (JT4) ±240°
	Axis 5 (JT5) ±120°
	Axis 6 (JT6) ±360°
Max. single axis speed	Axis 1 (JT1) 38°/s
	Axis 2 (JT2) 26°/s
	Axis 3 (JT3) 26°/s
	Axis 4 (JT4) 67.5°/s
	Axis 5 (JT5) 67.5°/s
	Axis 6 (JT6) 128.5°/s
Allowable moment	Axis 4 (JT4) 6.2 Nm
	Axis 5 (JT5) 1.45 Nm
	Axis 6 (JT6) 1.1 Nm
Working environment	Temperature 0–40°C
	Humidity 35–80%
Controller	Teensy 4.1
Inputs/Outputs	8/8 (PNP 8 mA, NPN 15 mA)
	2/2 (24V PNP on the JT3)
Max. current consumption	144 W
Power supply	100–240 V, 50–60 Hz
Weight	12 kg
Mounting position	Floor
Material	PET-G
Colour	Black
Communication	MODBUS TCP, TCP/IP, UDP, TLL SERIAL
Collision detection	Accelerometer
Power loss safety	Brakes on JT2 and JT3
Options	24V I/O-module 8 × Inputs / Outputs
	7 th axis Linear Track
	Vision system OpenMV
	Conveyor tracking Max. 2 Encoder

ASTORINO ARDUINO LIBRARY

4 Safety instructions

4.1 General information on safety

Astorino robot does not incorporate breaks on other joints than 2 and 3. During power failure robot might collapse. User safety and vigilance is necessary.

Always ensure the personal safety of users and others when operating the robot arm or starting the robot cell!

- In its basic version, the robot has no safety-related components for the robotic workstation. Such components may be required, depending on the target application. The basic version of the robot is provided with an emergency stop button.
- CE marking: The robot arm, when operating in factory applications, must undergo a risk assessment and comply with applicable safety regulations to ensure personal safety. Depending on the outcome of the assessment, further safety features should be integrated. These typically include safety relays and door switches. The person responsible here is the commissioning engineer. Educational applications do not require additional safety components.
- The robot controller includes a 24 V power supply that must be supplied with mains voltage (100/240 V). Please check the label on the power supply. Only qualified personnel can connect the power supply to the mains and put it into operation.
- Works carried out on the robot's electronic components should only be performed by qualified personnel. Check current guidelines for electrostatic discharges (ESD).
- Always disconnect the robot from the power supply (100/240 V) when working on the robot base (controller) or any electronic components connected to the robot controller.
- Hot-plugging is forbidden! It could lead to a permanent damage to motor modules. Do not install or remove any modules or plug/disconnect connectors (e.g. emergency stop button, DIO modules, motor connectors) while the power is on.
- The robot arm must be placed on a stable surface and bolted or otherwise secured.
- Use and store the robot only in a dry and clean place.
- Use the system only in a room temperature (15° to 32°C) — recommended.

WARNING

Use only 3.3V Arduino compatible boards!

5V boards can damage astorino!

5 Arduino Library

5.1 Library introduction

Astorino robot can be controlled by this library with an Arduino compatible microcontroller achieving data transmission through astorino communication protocol. The communication can be realized by UART (Serial) communication protocol.

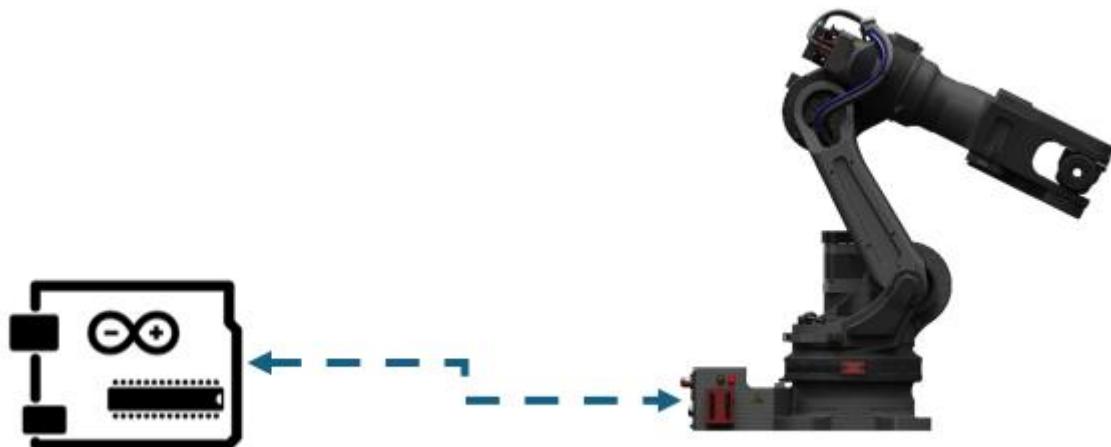

Library features:

- Realization of astorino communication protocol
- Long term support
- All methods and functions are blocking

All motion commands can be execute only in **REPEAT MODE**.

For more information about communication protocol please refer to astorino Communication Protocol Manual.

Library is not compatible with AVR based boards (not enough RAM), please use SAMD or ARM based microcontrollers like Teensy, Arduino Due, Arduino UNO R4 etc.

6 Files description

Library contains source code files and examples:

- astorino.h – header file
- astorino.cpp – source file of the library
- Simple.ino – simple example how to use the library.
- Advanced.ino – advanced example - RTC

ASTORINO ARDUINO LIBRARY

7 General Information

astorino robot is mainly programmed and operated in astorino software or Teach Pendant, not all functions and operations are available from library. Library should be used in combination with astorino software or robot's Teach Pendant.

⚠ WARNING

All motion commands can be executed only in REPEAT MODE! Greater user attention is strongly recommended!

8 Common return values

All methods return one of listed below values:

	RETURN CODE	DESCRIPTION
• Byte ReturnCode;	0X00	Instruction completed successfully
• Struct retVal:	0X01	CRC error
○ Double[] Values,	0X02	Estop or error
○ String Name,	0X03	Cycle is ON
○ List<string> Names,	0X04	SD save error
○ Byte[] bValues,	0X05	TeachMode – TP deadman switch is OFF
○ Byte ReturnCode	0X06	Cycle is OFF
• String[],	0X07	Robot is not ready
• Struct TransformationPoints:	0X08	Value out range
○ Double[,] points,	0X09	AS command failed
○ Byte ReturnCode,	0X10	Unknown command ID
• Struct JointPoints:	0X11	Data frame error
○ Double[,] points,	0X12	Motion out of range
○ Byte ReturnCode	0X13	JT command suddenly changed
	0X14	Motion out of Working Space
	0X15	Robot is already in motion
	0X16	Zeroing is not done
	0X17	Mastering data missing
	0X18	Not allowed in TeachMode
	0X19	Zeroing already done
	0X20	Response timeout
	0X21	Point does not exist
	0X22	Wrong data
	0X23	Program is not selected
	0X24	Motion command exceeded maximum joint speed
	0X25	RTC is OFF
	0X26	HOLD is active
	0X27	Motion disturbed
	0XFE	Send instruction failed
	0xFF	Communication is not established

In case of structs as returned values only if ReturnCode is 0x00 then other values are correctly returned.

For example `retVal ret = ForwardKinematics(...)` only returned correct values if `ret.ReturnCode = 0x00`, then `ret.Values[]` contains calculation results.

ASTORINO ARDUINO LIBRARY

TransformationPoint and JointPoints are described like this [index, {values}] for example

index	val1	val2	val3	val4	val5	val6	val7	exist
0	90	100	-20	45	66	44	0	1
1	0	0	0	0	0	0	0	0
2	10	-10	45	1	12	11	0	1

If exist is equal to 1 then point is saved in robots memory.

8.1 Common methods

Those methods are used to set common parameters of library.

8.1.1 Get Library Version

Prototype	<code>string getLibVersion()</code>
Description	returns library version
Parameters	void
Return	string

8.2 Set TimeOut

Prototype	<code>void setTimeOut(int timeOut)</code>
Description	sets communication TimeOut for non-motion instructions (default 1000 ms)
Parameters	timeOut: value in ms
Return	void

8.3 Set Motion TimeOut

Prototype	<code>void setMotionTimeOut(int timeOut)</code>
Description	sets communication TimeOut for motion instructions (default 30000 ms)
Parameters	timeOut: value in ms
Return	void

8.4 Set Serial(UART) TimeOut

Prototype	<code>void setUartTimeout(int timeout)</code>
Description	sets communication TimeOut – after timeout astorino disconnects
Parameters	timeout: value in ms
Return	void

8.4.1 Connect

Prototype	<code>byte Connect(string path)</code>
Description	starts connection with a robot
Parameters	path: COM port name or IP Adress in string format e.g “COM3”
Return	byte ReturnCode

ASTORINO ARDUINO LIBRARY

8.4.2 Disconnect

Prototype	<code>byte Disconnect()</code>
Description	closes connection with a robot
Parameters	void
Return	<code>byte ReturnCode</code>

8.4.3 Cancel Motion

Prototype	<code>byte cancelMotion()</code>
Description	cancels current motion – robot decelerates and stops – cycle is off afterwards
Parameters	void
Return	<code>byte ReturnCode</code>

8.4.4 Emergency Stop

Prototype	<code>byte emergencyStop()</code>
Description	stops current motion – robot stops immediately – cycle is off afterwards
Parameters	void
Return	<code>byte ReturnCode</code>

8.5 Kinematics and unit conversion methods

8.5.1 Forward Kinematics

Prototype	<code>retval ForwardKinematics(double jt1, double jt2, double jt3, double jt4, double jt5, double jt6, double jt7)</code>
Description	return forward kinematics calculation result
Parameters	double jt1..jt7 – axis angles in degrees [°]
Return	<p>retval:</p> <ul style="list-style-type: none"> - Double[] Values – calculation result (x,y,z,o,a,t,jt7)) in [mm] and [°] - ReturnCode

Prototype	<code>retval ForwardKinematics(double jt1, double jt2, double jt3, double jt4, double jt5, double jt6)</code>
Description	return forward kinematics calculation result
Parameters	double jt1..jt6– axis angles in degrees [°]
Return	<p>retval:</p> <ul style="list-style-type: none"> - Double[] Values – calculation result (x,y,z,o,a,t,jt7)) in [mm] and [°] - ReturnCode

ASTORINO ARDUINO LIBRARY

Prototype	<code>RetVal ForwardKinematics(double* jt, int lenght)</code>
Description	return forward kinematics calculation result
Parameters	double[] jt – axis angles in degrees [°]
Return	<p>RetVal:</p> <ul style="list-style-type: none"> - Double[] Values – calculation result (x,y,z,o,a,t,jt7) in [mm] and [°] - ReturnCode

8.5.2 Inverse Kinematics

Prototype	<code>RetVal InverseKinematics(double x, double y, double z, double o, double a, double t, double jt7)</code>
Description	return inverse kinematics calculation result
Parameters	double x,y,z, jt7 in [mm] o,a,t – in degrees [°]
Return	<p>RetVal:</p> <ul style="list-style-type: none"> - Double[] Values – calculation result (jt1, jt2 , jt3, jt4, jt5, jt6, jt7) in degrees [°] - ReturnCode

Prototype	<code>RetVal InverseKinematics(double x, double y, double z, double o, double a, double t)</code>
Description	return inverse kinematics calculation result
Parameters	double x,y,z in [mm] o,a,t – in degrees [°]
Return	<p>RetVal:</p> <ul style="list-style-type: none"> - Double[] Values – calculation result (jt1, jt2 , jt3, jt4, jt5, jt6, jt7) in degrees [°] - ReturnCode

Prototype	<code>RetVal InverseKinematics(double* pose, int lenght)</code>
Description	return inverse kinematics calculation result
Parameters	double[] pose (x,y,z,o,a,t,jt7) or (x,y,z,o,a,t) x,y,z,jt7 in [mm] o,a,t – in degrees [°]
Return	<p>RetVal:</p> <ul style="list-style-type: none"> - Double[] Values – calculation result (jt1, jt2 , jt3, jt4, jt5, jt6, jt7) in degrees [°] - ReturnCode

8.5.3 RPY to OAT conversion

Prototype	<code>RetVal toOAT(double rx, double ry, double rz)</code>
Description	return OAT angles calculated from RPY
Parameters	double rx, ry, rz in degrees [°]
Return	<p>RetVal:</p> <ul style="list-style-type: none"> - Double[] Values – calculation result (o, a, t) in degrees [°] - ReturnCode

ASTORINO ARDUINO LIBRARY

8.5.4 OAT to RPY conversion

Prototype	<code>retval toRPY(double o, double a, double t)</code>
Description	return RPY angles calculated from OAT
Parameters	double o, a, t in degrees [°]
Return	<p>retval:</p> <ul style="list-style-type: none"> - Double[] Values – calculation result (rx, ry, rz) in degrees [°] - ReturnCode

8.6 Read robot status and parameters methods

8.6.1 Read Status bytes

Prototype	<code>retval readStatusBytes()</code>
Description	reads all status bytes described in Communication Protocol Manual
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - byte[] bValues – status bytes [1..5] - ReturnCode

8.6.2 Read motors status

Prototype	<code>retval isMotorOn()</code>
Description	read the status of motors
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – MotorsON, -1 - MotorsOff - ReturnCode

8.6.3 Read inHOME bit status

Prototype	<code>retval isInHome()</code>
Description	read the status of in Home status
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – in Home, -1 – not in Home - ReturnCode

ASTORINO ARDUINO LIBRARY

8.6.4 Read Repeat Mode bit status

Prototype	<code>retval</code> <code>isRepeatModeOn()</code>
Description	read current selected robot mode (Repeat/Teach mode)
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – in Repeat Mode, -1 – Teach Mode - ReturnCode

8.6.5 Read HOLD bit status

Prototype	<code>retval</code> <code>isHoldOn()</code>
Description	read HOLD bit status
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – in HOLD is ON, -1 – HOLD is OFF - ReturnCode

8.6.6 Read Cycle On bit status

Prototype	<code>retval</code> <code>isCycleOn()</code>
Description	read Cycle On bit status
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – Cycle is ON, -1 – Cycle is OFF - ReturnCode

8.6.7 Read E-Stop bit status

Prototype	<code>retval</code> <code>isEstopOn()</code>
Description	read Emergency stop bit status
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – E-Stop is ON, -1 – E-stop is OFF - ReturnCode

8.6.8 Read Error bit status

Prototype	<code>retval</code> <code>isErrorOn()</code>
Description	read Error On bit status
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – Error is ON, -1 – Error is OFF - ReturnCode

ASTORINO ARDUINO LIBRARY

8.6.9 Read Ready bit status

Prototype	<code>retval</code> <code>isReadyOn()</code>
Description	read Ready bit status
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – Ready is ON, -1 – Ready is OFF - ReturnCode

8.6.10 Read External Hold On bit status

Prototype	<code>retval</code> <code>isExternalHoldOn()</code>
Description	read Cycle On bit status
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – Cycle is ON, -1 – Cycle is OFF - ReturnCode

8.6.11 Read Safety Fence On bit status

Prototype	<code>retval</code> <code>isSafetyFenceOn()</code>
Description	read Safety Fence On bit status
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – Safety Fence is ON, -1 – Safety Fence is OFF - ReturnCode

8.6.12 Read Repeat Cont On bit status

Prototype	<code>retval</code> <code>isRepeatContOn()</code>
Description	read Repeat Cont On bit status
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – Repeat Cont is ON, -1 – Repeat Cont is OFF (Repeat Once is ON) - ReturnCode

8.6.13 Read Step Once On bit status

Prototype	<code>retval</code> <code>isStepOnceOn()</code>
Description	read Step Once On bit status
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – Step Once is ON, -1 – Step Once is OFF (Step Cont is ON) - ReturnCode

 ASTORINO ARDUINO LIBRARY

8.6.14 Read Step Waiting On bit status

Prototype	<code>retval</code> isStepWaitingOn()
Description	read Step waiting On bit status
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – Step is waiting, -1 – Step is not waiting - ReturnCode

8.6.15 Read DryRun status

Prototype	<code>retval</code> isDryRunOn()
Description	read DryRun status
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – DryRun is ON, -1 – DryRun is OFF - ReturnCode

8.6.16 Read Zeroing Done bit status

Prototype	<code>retval</code> isZeroingDone()
Description	read Zeroing done status
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – Zeroing is done, -1 – Zeroing is not done - ReturnCode

8.6.17 Read inMotion bit status

Prototype	<code>retval</code> isInMotion()
Description	read if robot is currently in motion
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – in Motion, -1 – robot is not moving - ReturnCode

8.6.18 Read I/O Active Module On bit status

Prototype	<code>retval</code> isIOActive()
Description	read status of an IO module
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – IO module is ON, -1 – IO module is off - ReturnCode

ASTORINO ARDUINO LIBRARY

8.6.19 Read ModbusConnected bit status

Prototype	<code>retval</code> isModbusConnected()
Description	read Modbus connected status bit
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – is connected, -1 – is disconnected - ReturnCode

8.6.20 Read Collision detection module active bit status

Prototype	<code>retval</code> isCollisionDetectionActive()
Description	read Collision detection module status
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – Collision detection is ON, -1 – Collision detection is OFF - ReturnCode

8.6.21 Read Zeroing is running bit status

Prototype	<code>retval</code> isZeroingRunning()
Description	read zeroing is running bit status
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – zeroing is running, -1 – zeroing is not running - ReturnCode

8.6.22 Read Teach motion active bit status

Prototype	<code>retval</code> isTeachMotionActive()
Description	read an information if user is moving a robot in Teach mode
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – Active, -1 – not Active - ReturnCode

8.6.23 Read in motion command bit status

Prototype	<code>retval</code> isMotionCommand()
Description	read if robot is executing motion command in TeachMode
Parameters	void
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – Active, -1 – not Active - ReturnCode

 ASTORINO ARDUINO LIBRARY

8.6.24 Read currently selected Teach Motion speed

Prototype	<code>RetVal</code> <code>readSelectedTeachSpeed()</code>
Description	reads currently selected Teach motion speed
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: [1..5] - ReturnCode

8.6.25 Read currently selected TOOL number

Prototype	<code>RetVal</code> <code>readSelectedToolNumber()</code>
Description	reads currently selected Tool number
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: [1..4] - ReturnCode

8.6.26 Read currently selected Teach motion mode

Prototype	<code>RetVal</code> <code>readSelectedTeachMotionMode()</code>
Description	reads currently selected Teach motion mode
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – TOOL, 2 – JOINT, 3 – CONV, 4 – BASE, 5 - WORK - ReturnCode

8.6.27 Read endstop (Hall sensor) state

Prototype	<code>RetVal</code> <code>isHallSensorOn(int jt)</code>
Description	reads current state of a joints zeroing-hall sensor
Parameters	<code>jt</code> – joint number
Return	retVal: <ul style="list-style-type: none"> - int iVal: 1 – sensor is ON, -1 – sensor is OFF - ReturnCode

8.6.28 Read current joint position

Prototype	<code>RetVal</code> <code>JT()</code>
Description	reads current robot position – joint angles in degrees
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - Double[] Values – (jt1, jt2, jt3, jt4, jt5, jt6, jt7) in degrees [°] - ReturnCode

ASTORINO ARDUINO LIBRARY

8.6.29 Read current joint velocity

Prototype	<code>RetVal JT_Velocity()</code>
Description	reads current robot speed – joint velocity in degrees/s
Parameters	void
Return	<p>RetVal:</p> <ul style="list-style-type: none"> - Double[] Values – (jt1, jt2, jt3, jt4, jt5, jt6, jt7) in degrees/s [°/s] - ReturnCode

8.6.30 Read current Pose

Prototype	<code>RetVal Pose()</code>
Description	reads current robot position – pose
Parameters	void
Return	<p>RetVal:</p> <ul style="list-style-type: none"> - Double[] Values – (x, y, z, o, a, t, jt7) in [mm] and degrees [°] - ReturnCode

8.6.31 Read current TCP speed

Prototype	<code>RetVal TCP_Velocity()</code>
Description	reads current robot speed – TCP velocity
Parameters	void
Return	<p>RetVal:</p> <ul style="list-style-type: none"> - Double[] Values – (dx, dy, dz, drx, dry, drz, dt7) in [mm/s] and degrees/s [°/s] - ReturnCode

8.6.32 Read current CPU temperature

Prototype	<code>RetVal cpuTemp()</code>
Description	reads current CPU temperature
Parameters	void
Return	<p>RetVal:</p> <ul style="list-style-type: none"> - int iVal – temperature in [°C] - ReturnCode

8.6.33 Read current Monitor speed

Prototype	<code>RetVal readMonitorSpeed()</code>
Description	reads current Monitor speed
Parameters	void
Return	<p>RetVal:</p> <ul style="list-style-type: none"> - int iVal – monitor speed [%] - ReturnCode

ASTORINO ARDUINO LIBRARY

8.6.34 Read error code

Prototype	<code>retval</code> <code>readErrorCode()</code>
Description	reads error code
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - int iVal – error code - ReturnCode

8.6.35 Read serial number

Prototype	<code>retval</code> <code>serialNumber()</code>
Description	reads robots serial number
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - string Name – serial number - ReturnCode

8.6.36 Read firmware version

Prototype	<code>retval</code> <code>firmwareVersion()</code>
Description	reads robots firmware version
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - string Name – firmware version - ReturnCode

8.6.37 Read all Transformation Points

Prototype	<code>TransformationPoints</code> <code>readTransPointsData()</code>
Description	reads all transformation points data (Pxx)
Parameters	void
Return	TransformationPoints: <ul style="list-style-type: none"> - Double[,] points – array of positions [index,[x,y,z,o,a,t,jt7, exist]] - ReturnCode

8.6.38 Read one Transformation Point data

Prototype	<code>retval</code> <code>readTransformationPoint(int index)</code>
Description	reads selected transformation point data (Pxx)
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - Double[] Values – array [x,y,z,o,a,t,jt7] - ReturnCode

ASTORINO ARDUINO LIBRARY

8.6.39 Read all Joint Points

Prototype	JointPoints readJointPointsData()
Description	reads all joint points data (#Pxx)
Parameters	void
Return	JointPoints: <ul style="list-style-type: none"> - Double[,] points – array of positions [index,jt1,jt2,jt3,jt4,jt5,jt6,jt7, exist]] - ReturnCode

8.6.40 Read one Joint Point data

Prototype	RetVal readJointPoint(int index)
Description	reads selected joint point data (#Pxx)
Parameters	void
Return	RetVal: <ul style="list-style-type: none"> - Double[] Values – array [jt1,jt2,jt3,jt4,jt5,jt6,jt7] - ReturnCode

8.6.41 Read TOOL transformation

Prototype	RetVal readToolData(int index)
Description	reads selected TOOL transformation data
Parameters	void
Return	RetVal: <ul style="list-style-type: none"> - Double[] points – array [x,y,z,o,a,t] - ReturnCode

8.6.42 Read all stored programs names

Prototype	RetVal readProgramsName()
Description	reads all saved programs names in robots memory
Parameters	void
Return	RetVal: <ul style="list-style-type: none"> - string[,] Names – array of programs names - ReturnCode

8.6.43 Read main (start-up) program name

Prototype	RetVal mainProgram()
Description	reads the name of a start-up program
Parameters	void
Return	RetVal: <ul style="list-style-type: none"> - string Name - ReturnCode

 ASTORINO ARDUINO LIBRARY

8.6.44 Read selected program name

Prototype	<code>RetVal selectedProgram()</code>
Description	reads the name of a selected program
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - string Name - ReturnCode

8.6.45 Read accelerometer data

Prototype	<code>RetVal AccelerometerData()</code>
Description	reads accelerometer data (valid only for B-version)
Parameters	void
Return	retVal: <ul style="list-style-type: none"> - Double[] Values – array [x,y,z] - ReturnCode <p>Accelerometer data contains data of 3 axes. Range is from -2G to 2G.</p>

ASTORINO ARDUINO LIBRARY

8.7 Set robot status and parameters methods

8.7.1 Set Motors ON

Prototype	<code>byte setMotorOn()</code>
Description	turns motors on
Parameters	void
Return	byte ReturnCode

8.7.2 Set Motors OFF

Prototype	<code>byte setMotorOff()</code>
Description	turns motors off
Parameters	void
Return	byte ReturnCode

8.7.3 Reset

Prototype	<code>byte reset()</code>
Description	resets error and if possible sets Ready status
Parameters	void
Return	byte ReturnCode

8.7.4 Hold

Prototype	<code>byte Hold()</code>
Description	Holds the robot task execution
Parameters	void
Return	byte ReturnCode

8.7.5 Run (hold off)

Prototype	<code>byte Run()</code>
Description	Turns off Hold switch – resumes the robot task execution
Parameters	void
Return	byte ReturnCode

8.7.6 Turn DryRun On

Prototype	<code>byte turnDryRunOn()</code>
Description	turns on the DryRun mode
Parameters	void
Return	byte ReturnCode

ASTORINO ARDUINO LIBRARY

8.7.7 Turn DryRun Off

Prototype	<code>byte turnDryRunOff()</code>
Description	turns off the DryRun mode
Parameters	void
Return	byte ReturnCode

8.7.8 Set Repeat Cont On

Prototype	<code>byte setRepeatCont()</code>
Description	turns on looping of an AS written program
Parameters	void
Return	byte ReturnCode

8.7.9 Set Repeat Cont Off (Repeat Once)

Prototype	<code>byte setRepeatOnce()</code>
Description	turns off looping of an AS written program
Parameters	void
Return	byte ReturnCode

8.7.10 Set Step Once

Prototype	<code>byte setStepOnce()</code>
Description	turns on step mode execution of an AS written program
Parameters	void
Return	byte ReturnCode

8.7.11 Set Step Cont

Prototype	<code>byte setStepCont()</code>
Description	turns off step mode execution of an AS written program
Parameters	void
Return	byte ReturnCode

8.7.12 Next step

Prototype	<code>byte nextStep()</code>
Description	executes a next step of currently running program in step Once mode
Parameters	void
Return	byte ReturnCode

8.7.13 Cycle start

Prototype	<code>byte cycleStart()</code>
Description	turns on the execution of a selected AS written program
Parameters	void
Return	byte ReturnCode

ASTORINO ARDUINO LIBRARY

8.7.14 Cycle stop

Prototype	<code>byte cycleStop()</code>
Description	turns off the execution of a selected AS written program – robot decelerates and stops
Parameters	void
Return	byte ReturnCode

8.7.15 Set currently selected TOOL number

Prototype	<code>byte setTool(int index)</code>
Description	selects currently tool number used by robot
Parameters	index – tool number [1, 2, 3]
Return	byte ReturnCode

8.7.16 Set currently selected WORK number

Prototype	<code>byte setWork(int index)</code>
Description	selects currently work number used by robot
Parameters	index – tool number [1, 2]
Return	byte ReturnCode

8.7.17 Set HOME data to current position of a robot

Prototype	<code>byte setHomeHere()</code>
Description	sets HOME position to current position of a robot
Parameters	void
Return	byte ReturnCode

8.7.18 Set monitor speed

Prototype	<code>byte setMonitorSpeed(int speed)</code>
Description	sets monitor speed [1-100%]
Parameters	speed – 1 – 100 [%]
Return	byte ReturnCode

8.7.19 Set HOME position to specific data

Prototype	<code>byte setHome(double jt1, double jt2, double jt3, double jt4, double jt5, double jt6, double jt7)</code>
Description	sets robots HOME position to a specific data
Parameters	double jt1..jt7 – in degrees [°]
Return	byte ReturnCode

Prototype	<code>byte setHome(double jt1, double jt2, double jt3, double jt4, double jt5, double jt6)</code>
Description	sets robots HOME position to a specific data
Parameters	double jt1..jt6 – in degrees [°]
Return	byte ReturnCode

ASTORINO ARDUINO LIBRARY

Prototype	<code>byte setHome(double* jt, int lenght)</code>
Description	sets robots HOME position to a specific data
Parameters	double[] jt – in degrees [°]
Return	byte ReturnCode

8.7.20 Save current position to a Joint point

Prototype	<code>byte saveCurrentJointsAsPoint(int point)</code>
Description	saves current position (joint angles) of a robot to a selected point (#Px)
Parameters	point – point number from #P list [0-99]
Return	byte ReturnCode

8.7.21 Save current position to a Transformation point

Prototype	<code>byte saveCurrentPoseAsPoint(int point)</code>
Description	saves current position (pose) of a robot to a selected point (Px)
Parameters	point – point number from P list [0-99]
Return	byte ReturnCode

8.7.22 Set Main program (Start-up program)

Prototype	<code>byte setMainProgram (string name)</code>
Description	sets selected program as a start-up program
Parameters	name – program name
Return	byte ReturnCode

8.7.23 Select program (PRIME)

Prototype	<code>byte selectProgram (string name)</code>
Description	selects a program for execution
Parameters	name – program name
Return	byte ReturnCode

8.7.24 Remove point

Prototype	<code>byte removePoint (int number, int type)</code>
Description	saves current position (pose) of a robot to a selected point (Px)
Parameters	numer – point number [0-99], type – point type: 1 – Transformation (Px), 2 – Joint (#Px)
Return	byte ReturnCode

8.7.25 Set TOOL data

Prototype	<code>byte mainProgram(int index, double* data, int lenght)</code>
Description	sets TOOL data for a specific TOOL number
Parameters	int index – [1..3] double[] – {x,y,z,o,a,t}
Return	byte ReturnCode

ASTORINO ARDUINO LIBRARY

8.8 I/O methods

8.8.1 Read input state

Prototype	<code>retval readInput(int ind)</code>
Description	reads selected input state
Parameters	ind – IO index [1..58]
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – Input is ON, -1 – Input is OFF - ReturnCode

8.8.2 Read output state

Prototype	<code>retval readOutput(int ind)</code>
Description	reads selected output state
Parameters	ind – IO index [1..58]
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – Output is ON, -1 – Output is OFF - ReturnCode

8.8.3 Read internal signal state

Prototype	<code>retval readInternal(int ind)</code>
Description	reads selected internal signal state
Parameters	ind – internal signal index [1..16]
Return	<p>retval:</p> <ul style="list-style-type: none"> - int iVal: 1 – Internal signal is ON, -1 – Internal signal is OFF - ReturnCode

8.8.4 Set output state

Prototype	<code>byte setOutput(int ind, int state)</code>
Description	sets selected output state
Parameters	ind – IO index [1..58] state – signal state: 1 – ON, -1 - OFF
Return	byte ReturnCode

8.8.5 Set internal signal state

Prototype	<code>byte setInternal(int ind, int state)</code>
Description	sets selected internal signal state
Parameters	ind – internal signal index [1..16] state – signal state: 1 – ON, -1 - OFF
Return	byte ReturnCode

 ASTORINO ARDUINO LIBRARY

8.9 Synchronous motion methods (blocking)

8.9.1 Start Zeroing

Prototype	<code>byte Zero()</code>
Description	starts Zeroing procedure
Parameters	void
Return	byte ReturnCode

8.9.2 HOME

Prototype	<code>byte HOME(byte spd, byte acc, byte dec)</code>
Description	starts motion to HOME position in JOINT interpolation
Parameters	spd: [1..100%] acc: [0..100%] – if acc = 0 then initial speed of motion is set to spd dec: [0..100%] – if dec = 0 then final speed of motion is set to spd
Return	byte ReturnCode

8.9.3 JMOVE to saved position

Prototype	<code>byte JMOVE(byte pointType, byte pointIndex, byte spd, byte acc, byte dec)</code>
Description	starts motion to selected point in JOINT interpolation
Parameters	pointType: 1 – Transformation point, 2 – Joint point pointIndex: [0..99] point index spd: [1..100%] acc: [0..100%] dec: [0..100%]
Return	byte ReturnCode

8.9.4 JMOVE to point data

 **WARNING**

This command might cause rapid movement if sent data is incorrect! Greater user attention is strongly recommended!

Prototype	<code>byte JMOVE(byte pointType, byte spd, byte acc, byte dec, double* target, int lenght)</code>
Description	starts motion to target as a data array in JOINT interpolation
Parameters	pointType: 1 – Transformation point, 2 – Joint point spd: [1..100%] acc: [0..100%] dec: [0..100%] target: [val1, val2, val3, val4, val5, val6] or [val1, val2, val3, val4, val5, val6, val7] length – target array lenght
Return	byte ReturnCode

ASTORINO ARDUINO LIBRARY

8.9.5 JAPPRO to saved position

Prototype	<code>byte JAPPRO(byte pointType, byte pointIndex, byte spd, byte acc, byte dec, double offset)</code>
Description	starts approach motion to selected point in JOINT interpolation. Offset sets the distance from a destination point in [mm] in TOOL coordinate system according to Z direction
Parameters	<p>pointType: 1 – Transformation point, 2 – Joint point</p> <p>pointIndex: [0..99] point index</p> <p>spd: [1..100%]</p> <p>acc: [0..100%]</p> <p>dec: [0..100%]</p> <p>offset: [mm]</p>
Return	byte ReturnCode

8.9.6 JAPPRO to point data

WARNING

This command might cause rapid movement if sent data is incorrect! Greater user attention is strongly recommended!

Prototype	<code>byte JAPPRO(byte pointType, byte spd, byte acc, byte dec, double* target, int length, double offset)</code>
Description	starts approach motion to target as a data array in JOINT interpolation. Offset sets the distance from a destination point in [mm] in TOOL coordinate system according to Z direction
Parameters	<p>pointType: 1 – Transformation point, 2 – Joint point</p> <p>spd: [1..100%]</p> <p>acc: [0..100%]</p> <p>dec: [0..100%]</p> <p>target: [val1, val2, val3, val4, val5, val6] or [val1, val2, val3, val4, val5, val6, val7]</p> <p>length – target array lenght</p> <p>offset: [mm]</p>
Return	byte ReturnCode

8.9.7 LMOVE to saved position

Prototype	<code>byte LMOVE(byte pointType, byte pointIndex, byte spd, byte acc, byte dec)</code>
Description	starts motion to selected point in LINEAR interpolation
Parameters	<p>pointType: 1 – Transformation point, 2 – Joint point</p> <p>pointIndex: [0..99] point index</p> <p>spd: [1..250 mm/s]</p> <p>acc: [0..100%] – if acc = 0 then initial speed of motion is set to spd</p> <p>dec: [0..100%] – if dec = 0 then final speed of motion is set to spd</p>
Return	byte ReturnCode

8.9.8 LMOVE to point data

 **WARNING**

This command might cause rapid movement if sent data is incorrect! Greater user attention is strongly recommended!

Prototype	<code>byte LMOVE(byte pointType, byte spd, byte acc, byte dec, double* target, int lenght)</code>
Description	starts motion to target as a data array in LINEAR interpolation
Parameters	pointType: 1 – Transformation point, 2 – Joint point spd: [1..250 mm/s] acc: [0..100%] – if acc = 0 then initial speed of motion is set to spd dec: [0..100%] – if dec = 0 then final speed of motion is set to spd target: [val1, val2, val3, val4, val5, val6] or [val1, val2, val3, val4, val5, val6, val7] length – target array lenght
Return	byte ReturnCode

8.9.9 LAPPRO to saved position

Prototype	<code>byte LAPPRO(byte pointType, byte pointIndex, byte spd, byte acc, byte dec, double offset)</code>
Description	starts approach motion to selected point in LINEAR interpolation. Offset sets the distance from a destination point in [mm] in TOOL coordinate system according to Z direction
Parameters	pointType: 1 – Transformation point, 2 – Joint point pointIndex: [0..99] point index spd: [1..250 mm/s] acc: [0..100%] – if acc = 0 then initial speed of motion is set to spd dec: [0..100%] – if dec = 0 then final speed of motion is set to spd offset: [mm]
Return	byte ReturnCode

ASTORINO ARDUINO LIBRARY

8.9.10 LAPPRO to point data

 **WARNING**

This command might cause rapid movement if send data is incorrect! Greater user attention is strongly recommended!

Prototype	<code>byte LAPPRO(byte pointType, byte spd, byte acc, byte dec, double* target, int length, double offset)</code>
Description	starts approach motion to target as a data array in LINEAR interpolation. Offset sets the distance from a destination point in [mm] in TOOL coordinate system according to Z direction
Parameters	<p>pointType: 1 – Transformation point, 2 – Joint point spd: [1..250 mm/s] acc: [0..100%] – if acc = 0 then initial speed of motion is set to spd dec: [0..100%] – if dec = 0 then final speed of motion is set to spd target: [val1, val2, val3, val4, val5, val6] or [val1, val2, val3, val4, val5, val6, val7] length – target array lenght offset: [mm]</p>
Return	byte ReturnCode

8.9.11 CMOVE to saved position

Prototype	<code>byte CMOVE(byte pointType, byte pointIndex1, byte pointIndex2, byte spd, byte acc, byte dec)</code>
Description	starts motion to selected points in CIRCULAR interpolation, motion start in current position, via pointIndex1 and ends in pointIndex2
Parameters	<p>pointType: 1 – Transformation point, 2 – Joint point pointIndex1: [0..99] point index pointIndex2: [0..99] point index spd: [1..250 mm/s] acc: [1..100%] dec: [1..100%]</p>
Return	byte ReturnCode

ASTORINO ARDUINO LIBRARY

8.9.12 CMOVE to point data

 **WARNING**

This command might cause rapid movement if sent data is incorrect! Greater user attention is strongly recommended!

Prototype	<code>byte CMOVE(byte pointType, byte spd, byte acc, byte dec, double* middle, double* target, int lenght)</code>
Description	starts approach motion to target as a data array, via middle in CIRCULAR interpolation.
Parameters	<p>pointType: 1 – Transformation point, 2 – Joint point spd: [1..250 mm/s] acc: [1..100%] dec: [1..100%] middle: [val1, val2, val3, val4, val5, val6] or [val1, val2, val3, val4, val5, val6, val7] target: [val1, val2, val3, val4, val5, val6] or [val1, val2, val3, val4, val5, val6, val7] length – target array lenght</p>
Return	byte ReturnCode

8.10 RTC commands

RTC (Real Time Control) commands can control astorino in real time. User can inject motion offsets to cartesian motions or control the robot via external trajectory generator. Robot must be in REPEAT Mode. RTC is set to OFF automatically after disconnect or switching to Teach Mode.

 **WARNING**

Those commands might cause rapid movement if sent data is incorrect! Greater user attention is strongly recommended!

8.11 RTC commands

RTC (Real Time Control) commands can control astorino in real time. User can inject motion offsets to cartesian motions or control the robot via external trajectory generator. Robot must be in REPEAT Mode. RTC is set to OFF automatically after disconnect or switching to Teach Mode.

 **WARNING**

This commands might cause rapid movement if send data is incorrect! Greater user attention is strongly recommended!

ASTORINO ARDUINO LIBRARY

8.12 Turn on RTC

Prototype	<code>byte RTC_ON()</code>
Description	Turns on Real Time Control
Parameters	void
Return	ReturnCode

8.13 Turn off RTC

Prototype	<code>byte RTC_OFF()</code>
Description	Turns off Real Time Control
Parameters	Void
Return	ReturnCode

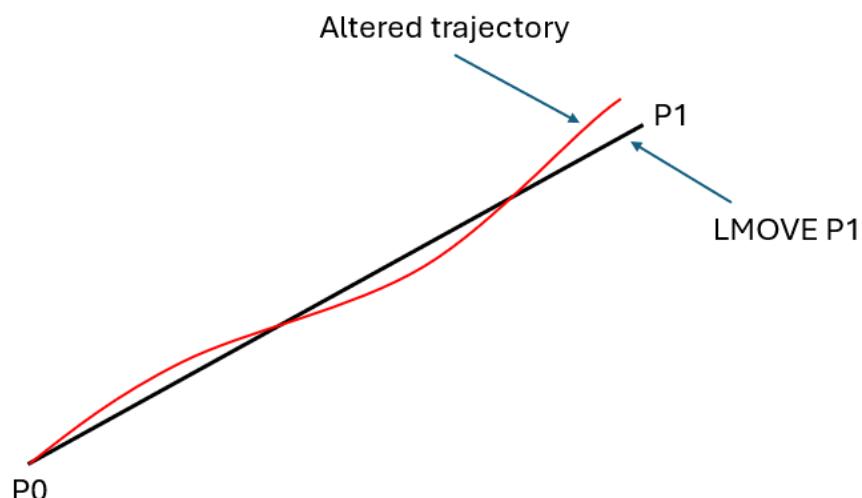

8.14 Set RTC offsets

To use this command RTC switch must be ON, Values are in [mm] and [deg].

 **WARNING**

This command might cause rapid movement if send data is incorrect! Greater user attention is strongly recommended!

RTC offset are added to currently used Linear and Circular Motion commands every 10 ms. That allows to alter current trajectory in real time. Maximum values are 2mm and 2 deg. Offset are cumulative, if not set to 0 will add up with every loop. Cumulative offsets are reset after each motion instruction has ended.

Offsets data are in cartesian units [x,y,z] and Euler RPY angles [rx, ry, rz]

ASTORINO ARDUINO LIBRARY

Prototype	<code>byte setRTC_OffsetData(double x, double y, double z, double rx, double ry, double rz)</code>
Description	Sets RTC offset for path modulation
Parameters	x,y,z in [mm] rx,ry,rz – in degrees [°]
Return	ReturnCode

Prototype	<code>byte setRTC_OffsetData(double* data, int lenght)</code>
Description	Sets RTC offset for path modulation
Parameters	data[x,y,z, rx,ry,rz] – in mm and degrees [°] length – data array lenght
Return	ReturnCode

8.15 Execute RTC data motion

To use this command RTC switch must be ON. Values are in absolute coordinates [xzyoat jt7 or joints angle deg 1..7]

 **WARNING**

This command might cause rapid movement if send data is incorrect! Greater user attention is strongly recommended!

Prototype	<code>byte RTC_move(byte type, byte time, double z, double* target, int lenght)</code>
Description	Executes motion to transmitted data. Motion is done in required time.
Parameters	Type: 0x01- JT angles, 0x02- Transformation data Time: unit [ms] target: [x, y, z, o, a, t] – units [mm] and degrees [°] length – target array lenght
Return	ReturnCode

 **WARNING**

This command do not implement acceleration and deceleration. It is up to user commands to realize that!

8.16 AS commands

8.16.1 Execute AS command

Prototype	<code>byte executeASCommand (string command)</code>
Description	Executes AS Language command
Parameters	Command – AS language command
Return	ReturnCode

ASTORINO ARDUINO LIBRARY

9 Example

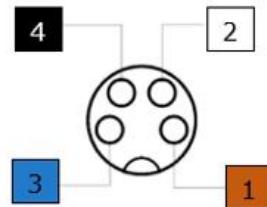

9.1 ARDUINO IDE example

Connect arduino compatible board to astorino Serial port

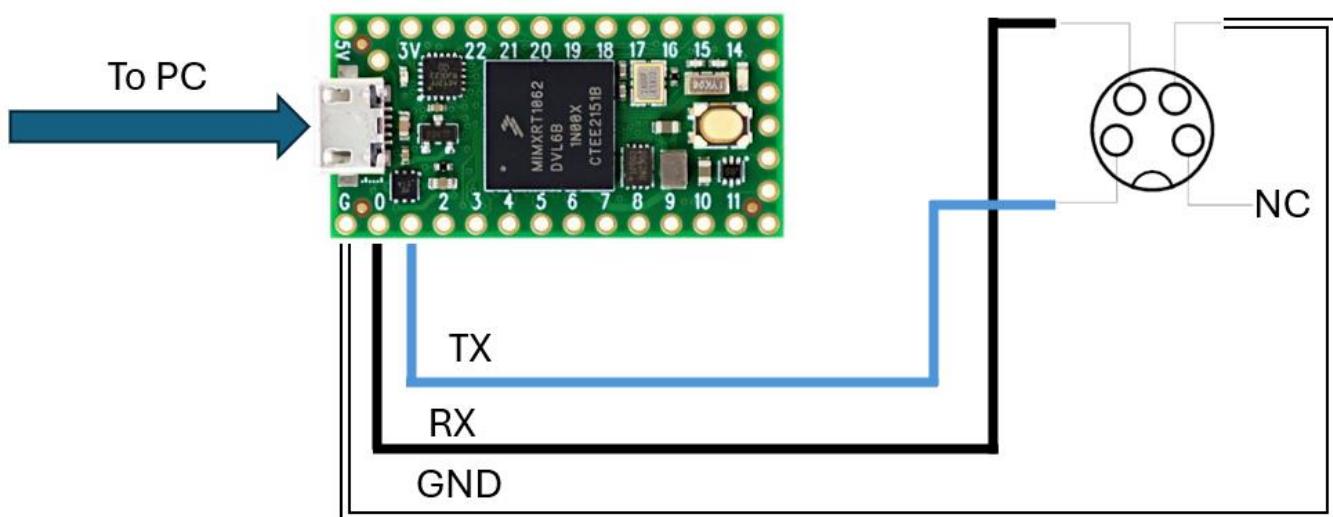

M8 connector pins:

- 1 - 5V,
- 2 - GND,
- 3 - TX,
- 4 - RX

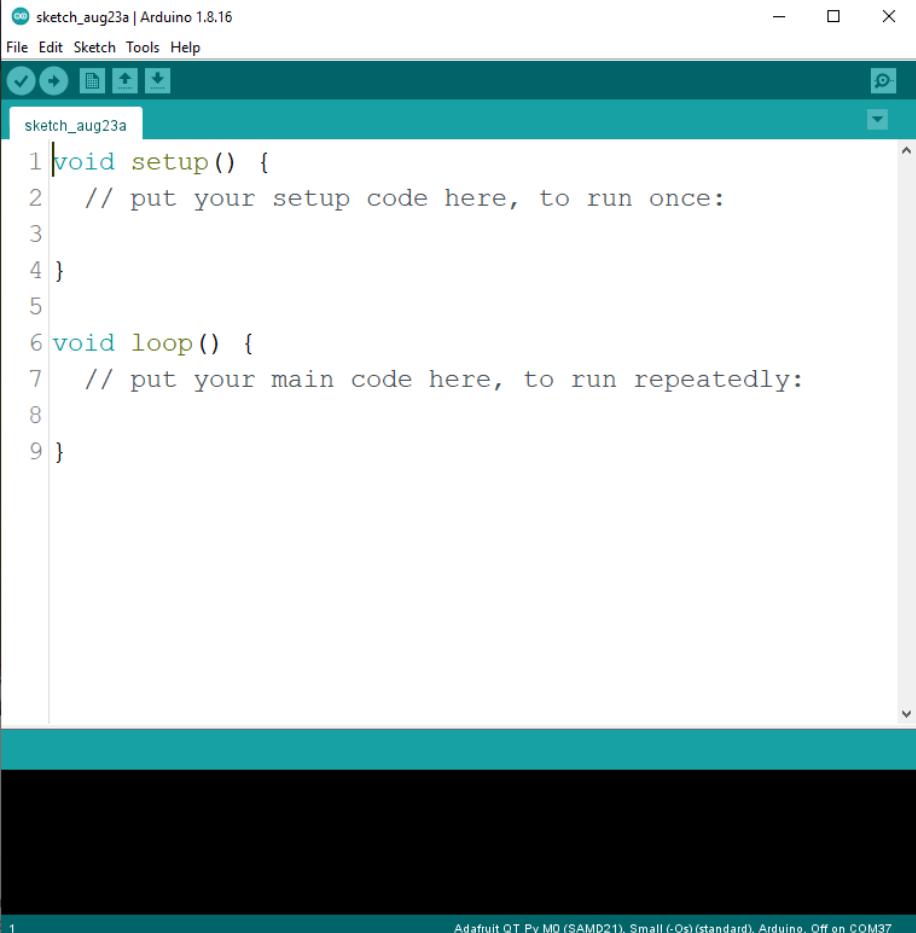

For example Teensy 4.0:

ASTORINO ARDUINO LIBRARY

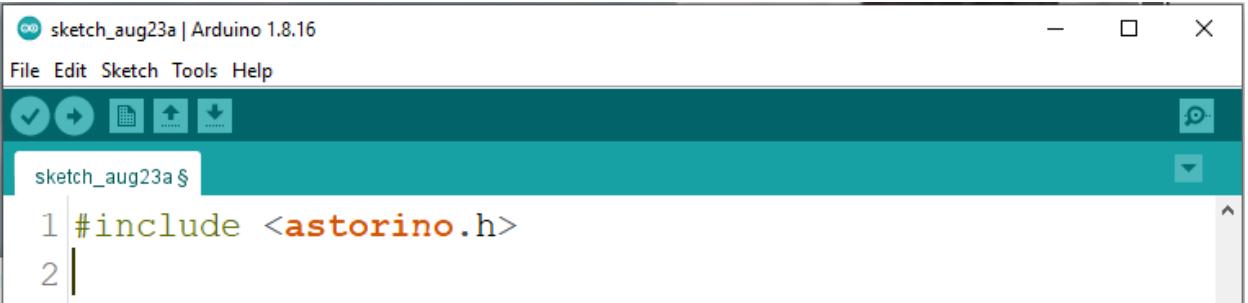

Copy astorino library folder to Arduino libraries directory.

Create a new Arduino project and choose proper board.

```
sketch_aug23a | Arduino 1.8.16
File Edit Sketch Tools Help
sketch_aug23a
1 void setup() {
2   // put your setup code here, to run once:
3
4 }
5
6 void loop() {
7   // put your main code here, to run repeatedly:
8
9 }
```

Add astorino library [Sketch -> Include Library -> astorino]

```
sketch_aug23a | Arduino 1.8.16
File Edit Sketch Tools Help
sketch_aug23a §
1 #include <astorino.h>
2 |
```

Create your code.

ASTORINO ARDUINO LIBRARY

Example code:

```

#include "astorino.h"

astorino r(Serial1); // use Serial1 for UART communication
astorino::RetVal ret; //return value1

void setup()
{
    Serial.begin(115200);

    delay(1000);
    if(r.Connect() == 0) //open connection
    {
        r.setUartTimeout(1000); //set connection timeout to 1000 ms
        r.setMotorOn(); //turn on MOTORS
        delay(1000);
        r.Zero(); // start zeroing procedure
        Serial.println("Zeroing done");
        r.HOME(80,90,90); //go to HOME position
        Serial.println("In HOME");
        ret = r.Pose(); // read current position
        if (ret.returnCode == 0)
        {
            Serial.print(ret.values[0]); //x
            Serial.print(" ");
            Serial.print(ret.values[1]); //y
            Serial.print(" ");
            Serial.println(ret.values[2]); //z
        }
        ret = r.selectedProgram(); // read currently selected program
        if (ret.returnCode == 0)
        {
            Serial.println(ret.name);
        }
        delay(1000);
        delay(1000);
